

@KillaXBT

Trading Toolkit

Wick hunting at @scalpxofficial. Bitcoin order-flow trader. HTF swing thesis stitched from liquidation maps, FVGs, CME gaps, monthly opens, and diminishing-cycle math.

180k+

FOLLOWERS ON X

90% HTF accuracy
self-claimed this cycle

1. IDENTITY

STYLE

HTF directional swing
(weeks → months)

PRIMARY ASSET

BTC (>95% of output)
occasional ETH

FREQUENCY

1–3 long-form posts/day
plus weekly setup

SELF-BILLED FRAMEWORK

"Rotational market
mathematics"
+ diminishing cycle analysis

AFFILIATIONS

ScalpX trading desk
Bitunix affiliate

REPUTATION

Called \$121.3k cycle top
(actual ~\$126.1k, 3.9% off)

2. TOOLKIT — WHAT HE ACTUALLY USES

LIQUIDATION HEATMAPS (COINGLASS)

Reads **7-day (LTF)** and **30-day (HTF)** heatmaps simultaneously. Splits long-side vs short-side liquidation clusters, then trades the asymmetry into the heavier cluster.

"BTC is trapped between long and short liquidation zones in both low and high time frames signaling a moment of market indecision."

— @KillaXBT, June 2025 (NewsBTC)

ORDERBOOK DELTA / SPOT CVD

Watches **spot CVD slope vs price slope**. Buyers accumulating during a drop = HTF long signal.

"On this recent drop, orderbook delta has flipped positive. A sign that buyers are accumulating. Since September, every time delta has flipped green we have seen a push upwards on the HTF."

— @KillaXBT, Oct 15 2025 (InvestX)

FAIR VALUE GAPS (FVG / IMBALANCE)

ICT-style 3-candle gaps on the daily timeframe. Treats them as price magnets that "eventually get filled to rebalance order flow."

"Daily fair value gap extending down to \$113,355 ... such inefficiencies eventually get filled, as price retraces into the zone to rebalance order flow."

— Sept 2025

CME GAPS

Treats weekend CME gaps as near-guaranteed targets. Quoted historical fill rate: **98% since BTC at \$16k**.

"Since trading at \$16,000, the Bitcoin market has seen 98% of weekend CME gaps filled."

— XT.com, Aug 2025

WEEKLY / MONTHLY OPENS

Flippable pivots. Above monthly open = bullish bias; failure to hold = trigger to fade. Tracks every weekly open as the immediate level.

"Bitcoin started the month on a strong technical footing, flipping the monthly open at \$115,752 into support."

— Bitcoinist, Aug 2025

FUNDING RATE

Negative funding + capitulation = contrarian long trigger. Sustained high positive funding = exhaustion warning. Earns funding fees on shorts as part of his thesis.

111-DAY SMA

Binary trend filter on the daily. Below = no longs / size down. Above = trend reversal confirmed.

DIMINISHING CYCLE MULTIPLE

Cycle high-to-low decay: **15.5x** → **7.6x** → **6.3x** → **4.5x** → **3.25x** projected. Divides current ATH (\$126k) by 3.25 to project a **\$38.8k cycle bottom**.

3. PER-TIMEFRAME FOCUS

TIMEFRAME	WHAT HE USES IT FOR
1W / 1M	The decision layer. "Weekly close above \$80k invalidates my short." Monthly opens, monthly FVGs, monthly highs/lows.
1D	Bias and key-level mapping. Daily FVGs, daily POIs, 111-day SMA as trend confirmation.
4H	Range structure. Marks "ideal long zones" and supply pockets (\$115k demand, \$112–113.8k imbalance).
1H	LTF execution refinement. "LTF downtrend line break", liquidation cluster invalidation.
15m / 5m	Rarely referenced publicly. Delegates this to ScalpX desk colleagues (Saint, etc.) who run scalp setups.

4. HOW HE STACKS CONFLUENCES

Notable example — March 16 2026 short thesis built from **5 stacked signals**:

"We have 7 green consecutive daily candles, We pump over the weekend, We form a CME gap below, Directly into supply/liquidity, At the start of a new weekly open, And all of a sudden \$BTC is bullish? Got it."

— @KillaXBT, March 16 2026 (Coincu). Price subsequently dropped from ~\$84k to mid-\$70k.

Lesson: he does not take single-signal trades. Conviction comes from **3+ stacked confluences** pointing the same direction.

5. RISK MANAGEMENT RULES

POSITION SIZE 10–15% of portfolio per HTF swing	LEVERAGE 2.5–3x cross (his swings) 3–4x recommended ceiling for users NEVER 10x
MARGIN TYPE Cross > isolated. "Cross margin allows me to absorb volatility without emotional reaction."	LIQUIDATION DISTANCE Sets liquidation 40%+ from entry
STOP LOSS DISCIPLINE Weekly-close based for HTF swings. Will move SL UP, never DOWN. Wicks don't invalidate; closes do.	R:R FRAMING Asymmetric. Risks 10–15% to capture 30–50% expected move.

6. VOCABULARY CHEAT SHEET

Recurring phrases — internalize these to think in his framework.

- ▶ Mechanical price action
- ▶ Textbook range
- ▶ Double sweep
- ▶ Monthly open trap
- ▶ CME gap as magnet
- ▶ FVG fill
- ▶ Spot vs perp divergence
- ▶ Capitulation long
- ▶ Market-maker orchestrated
- ▶ Liquidity grab
- ▶ Wick low / wick high
- ▶ Weekly open as pivot
- ▶ Imbalance zone
- ▶ Diminishing cycle multiple
- ▶ HTF accumulation
- ▶ Asymmetric R:R

7. TO BECOME LIKE HIM — RANKED STUDY PATH

Tailored for someone already running fib + OI + funding + CVD on Binance/Bybit.

1. **Add a Coinglass liquidation heatmap pane** to the dashboard. Read 7d + 30d simultaneously. Mark dense clusters as TP/SL targets. **Single biggest gap to close.**
2. **Add CME futures BTC chart** and tag every weekend gap. Maintain a live "unfilled CME gaps" list as TP candidates.
3. **Anchor fib swings to the prior monthly open** instead of arbitrary swings. Hypothesis: tighter stops + cleaner confluence.
4. **Spot-CVD vs perp-CVD divergence alerting.** Trigger when 4H spot CVD slope is opposite price slope. Killa explicitly trades this.
5. **Mark daily FVGs as a chart overlay** (3-candle imbalance gaps). Long when fib 0.5–0.618 zone overlaps an unfilled bullish FVG.
6. **Add 111-day SMA** to BTC chart as a binary trend filter. Below = no longs / reduce size.
7. **Adopt the "weekly close" stop rule** for HTF swings. Stop using intraday SLs for swings.
8. **Track every monthly open** as a flippable pivot. Above = bullish bias; below = bearish.
9. **Reduce leverage on small-range setups.** Killa's max 3–4x rule on 4–5% range setups.
10. **Build a personal "scenarios" template.** Each Sunday evening: write Scenario 1 / Scenario 2 / Invalidation in his format.

8. DAILY HABITS TO COPY

- **Sunday evening:** write the next week's scenario plan in two short paragraphs (favored / alternative / invalidation).
- **Monday + Friday:** check funding rate extremes and OI delta at session opens.
- **Anytime BTC rallies on a weekend:** flag the resulting CME gap as a magnet.
- **Monthly close:** re-check whether monthly open flipped to support/resistance and rebias.

9. METHODOLOGY LINEAGE

KillaXBT's vocabulary and setups overlap with several established frameworks. Studying these gives you the underlying theory behind what he posts:

- **ICT (Inner Circle Trader / Michael J. Huddleston)** — order blocks, FVGs, killzones, OTE entry zone (0.62–0.79, which overlaps directly with the BTC fib levels 0.75 and 0.7816).
- **Wyckoff method** — accumulation/distribution phases, spring/upthrust, effort vs result.
- **Diminishing Cycles (Avramescu BDRT)** — the mathematical model behind the cycle-decay multiple.
